

THE MASCOT SLIDE RULE MANUAL

Set 4 on C to 96 on D, then set hairline to 8 on C. Read 4, answer under hairline on D. All movements this time were to left from 96.

TO FIND THE SQUARE OF A NUMBER

for example the square of 24 = 576

Set the cross rider hair on reverse side of rule at 24 on scale D which is the third scale from the outer circumference, and read 576 on scale A which is the second scale from outer circumference.

TO FIND THE SQUARE ROOT OF A NUMBER

for example the square root of 43 = 6.48

Set the rider cross hair at 43 scale A, which is the second scale from the out circumference and read 6.48 on Scale D which is the third scale from the outer circumference.

TO FIND THE SINE OF AN ANGLE

for example $\sin 30^\circ = 0.5$

Set cross hair on reverse side of scale on 30 of first scale and read 0.5 on second scale.

TO FIND THE TANGENT OF AN ANGLE

for example $\tan 30^\circ = 0.584$

Set cross hair on 30 on fourth scale from outer circumference on reverse side of rule and read 0.584 on third scale from outer circumference.

INSTRUCTIONS ON THE OPERATION OF THE MARCOT VEST POCKET SLIDE RULE

Mechanically this rule works scale against scale in the same manner as the ordinary straight slide rule and any one familiar with the conventional type of slide rule can work the MARCOT.

It is operated by placing the thumb on top disc and revolving it clockwise or contra clockwise until factors are in desired relation to each other as indicated in following paragraphs.

TO MULTIPLY TWO NUMBERS

For example $5 \times 6 = 30$

The scale on outer ring is for LOGARITHMS, and is not used in ordinary multiplication and division. The second scale is usually known as the "D" Scale and is used in multiplication, division and proportions.

Set No. 1 of the inner revolving scale under 6 of D scale. Above 5 of the inner C scale read the product 30 on the D scale. Likewise on the other D scale over each reading of the inner C scale will be found the product of that reading by 6.

TO DIVIDE ONE NUMBER BY ANOTHER

For example $36.5 \div 2.5 = 14.6$

Set No. 1 of the inner revolving scale ("C" Scale) under 2.5 on the outer scale ("D" Scale). Under 36.5 on the "D" Scale read 14.6 on the inner "C" scale. (Note — after the slide is set, the hair line of the rider may be set on 36.5 of outer "D" Scale to assist in reading "14.6" on inner "C" Scale.

TO FIND A NUMBER BEARING A CERTAIN RATIO TO ANOTHER NUMBER

for example $7 \div 4 \times 36 = 63$

Set No. 6 of inner revolving "C" Scale under 7 of the outer "D" scale. Over 36 of inner "C" scale read 63 on outer "D" scale. This illustrates the combination of multiplication and division into a single operation. Note that the 4 may be set to either of the factors of 7 or 36, whichever will require the least turning of the dial, and the answer will be found opposite the other factor.

TO FIND THE LOGARITHM OF A NUMBER

for example $\log 4.39 = 0.642$

Set cross hair at 4.39 of second ("D" scale) from outer circumference and read log at 0.642 on first scale at outer circumference.

TO MULTIPLY THREE FACTORS AT ONE SETTING USE OF CI SCALE

for example $4 \times 3 \times 6 = 72$

Set hair line to 4 on D scale bring 3 on CI scale (4th from outer edge of rule) to hairline, then at 6 on C find 72 on D. Note that these operations all cause motion to right on D. I. e. Hairline is first set 4 units to right of beginning on D, from 6 on CI to 1 on CI carries the 1 of C 8 units further to right, then reading at 6 carries us 6 units further to the answer on D.

TO DIVIDE A NUMBER BY TWO FACTORS USE OF CI SCALE

for example $96 \div 4 \div 6 = 4$
